

Два дня на реке Квай

TREATMENT OF SNAKEBITE

First aid. A tourniquet should immediately be applied to the limb above the wound tight enough to prevent the spreading of venom from the fang wounds into other parts of the limb. The tourniquet should be released every 10 minutes until antivenin serum can be administered. No alcoholic drinks should be given.

THE PRODUCTION OF ANTIVENINE SERUM

Antivenine serum is produced in horses by injecting controlled doses of snake venom for 3-6 months. The horse becomes immune to the effect of large doses of venom. The serum made from these immunised horses is effective in neutralising the action of the venom.
